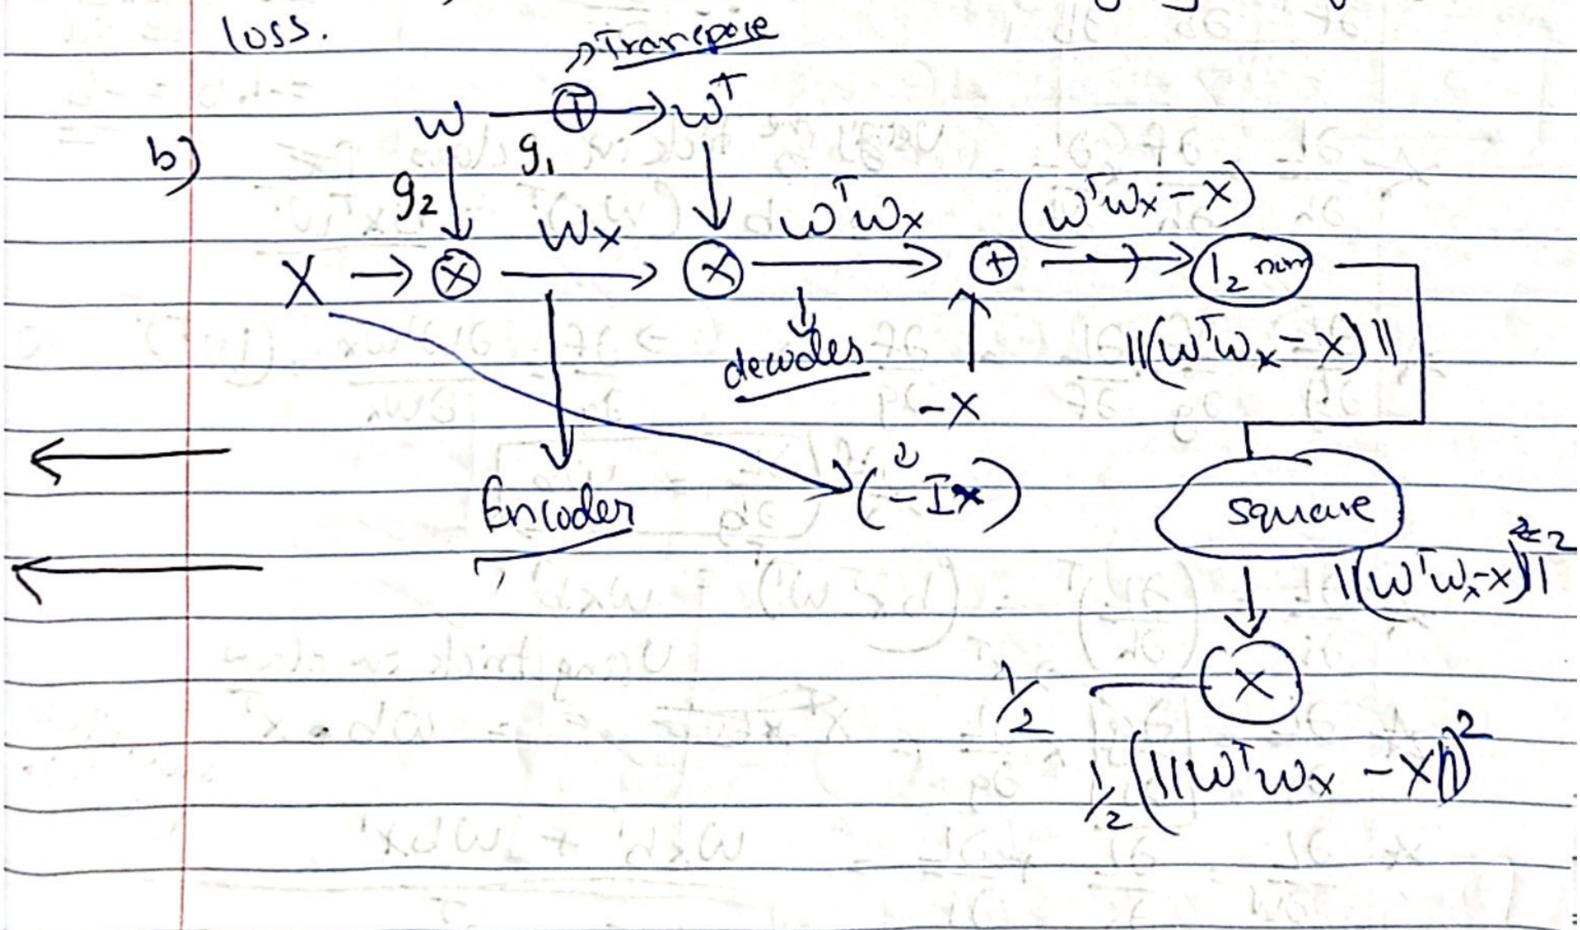
Homework 3 KRISH PATEL

(Q1) $W \in \mathbb{R}^{m \times n}$

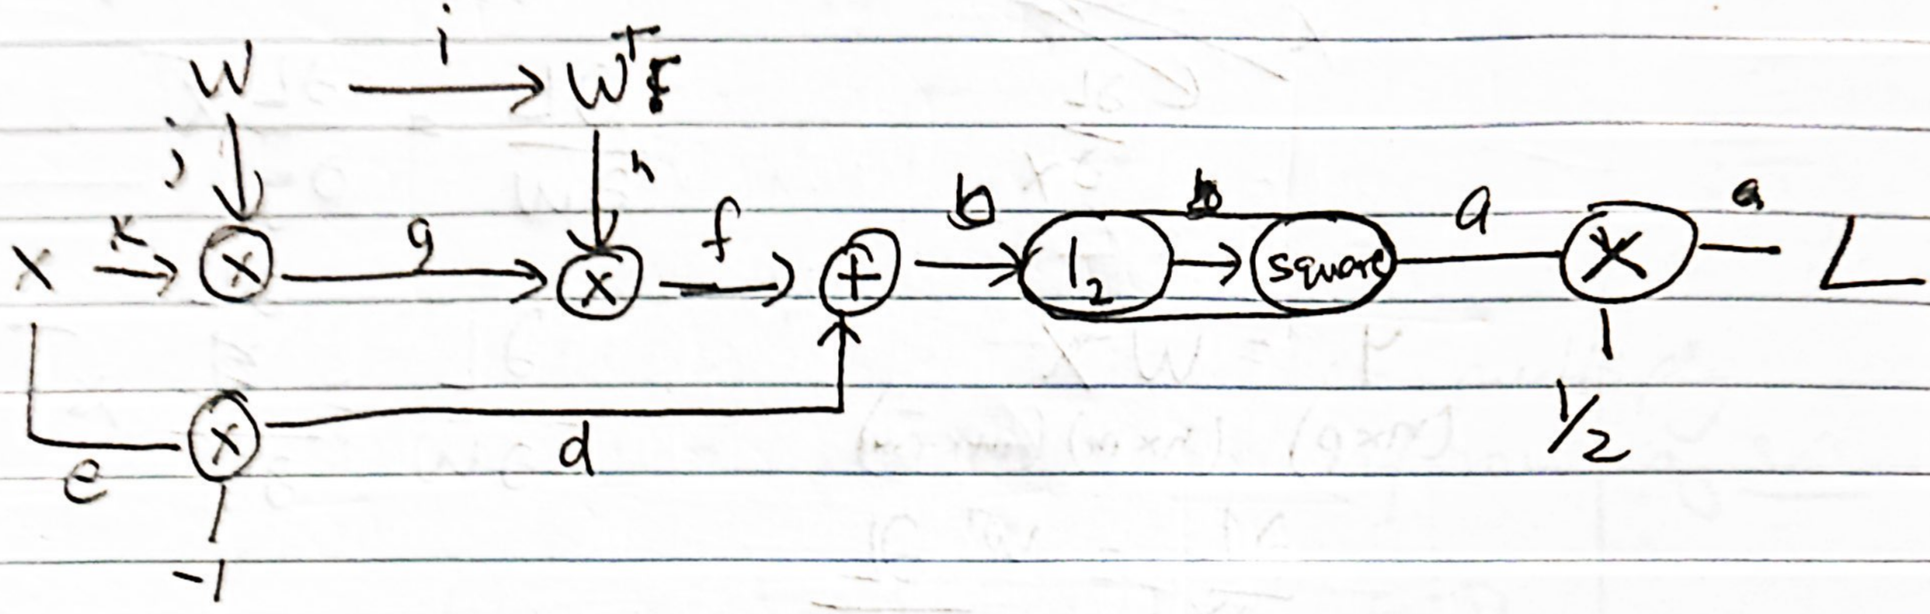
a) When W is a square matrix, (assumption) $W^T W$ would minimize the value of the transformation (If W^T is orthogonal, $W^T W$ would be equal to I, thus minimizing $(W^T W x - x)$. Now, moving to this example, W reduces the dimensionality of x, W^T is used for the reconstruction (similar to PCA). ~~By this~~ By minimizing the difference of the x' (reduced x dimensionity, which is the reconstructed to x's original dimension) and x, we are minimizing information loss.

b)



Scanned with CamScanner

count



c) W has 2 paths, one through Wx and one through $W \rightarrow (T) \rightarrow W^T \rightarrow W^T W x$.
These converge at $W^T W x$
Thus, we can just add this $\rightarrow$

$$\frac{\partial L}{\partial W} = \frac{\partial g_1}{\partial W} \cdot \frac{\partial L}{\partial g_1} + \frac{\partial g_2}{\partial W} \cdot \frac{\partial L}{\partial g_2}$$ where g_1 and g_2 are defined in the figure behind.

$a = \frac{1}{2} b^T b$ $\quad \cancel{(a-b)}$ $\quad 2b \cdot \frac{1}{2} = b$

d) ☆ $\frac{\partial L}{\partial a} = \frac{1}{2}$ $\qquad \frac{\partial L}{\partial b} = \frac{\partial a}{\partial b} \times \frac{\partial L}{\partial a} = \cancel{2b \times \frac{1}{2}} = b$

☆ $\frac{\partial L}{\partial f} = \frac{\partial f}{\partial b} \times \frac{\partial L}{\partial b} = 1 \times b = b \therefore \frac{\partial L}{\partial b} = b$ $\qquad \frac{\partial L}{\partial e} = \frac{\partial d}{\partial e} \times \frac{\partial L}{\partial d} = -1 \cdot b = \underline{-b}$

☆ $\frac{\partial L}{\partial h} = \frac{\partial f}{\partial h} \times \frac{\partial L}{\partial f} =$ Using the trick in class,
$= b \times (Wx)^T = \underline{b x^T W^T}$

☆ $\frac{\partial L}{\partial g} = \frac{\partial f}{\partial g} \times \frac{\partial L}{\partial f} = \frac{\partial f}{\partial g} \times b \rightarrow \frac{\partial f}{\partial g} = \frac{\partial W^T W x}{\partial W x} = (W^T)^T = W$

☆ $\boxed{\frac{\partial L}{\partial g} = Wb}$

☆ $\frac{\partial L}{\partial i} = \left(\frac{\partial L}{\partial h}\right)^T = (b x^T W^T)^T = W x b^T$
$\rightarrow x^T$ Using trick in class
☆ $\frac{\partial L}{\partial j} = \boxed{\frac{\partial g}{\partial j}} \times \frac{\partial L}{\partial g} = x^T \cancel{\times Wb} = Wb x^T$
☆ $\frac{\partial L}{\partial W} = \frac{\partial L}{\partial j} + \frac{\partial L}{\partial i} = W x b^T + W b x^T$ $\qquad$ substituting $b = W^T W x - x$

$$= \boxed{Wx(W^T W x - x)^T + W(W^T W x - x) x^T}$$

Q2) I am a ECE 147 student

Q3) NNDL to the Rescue!!!!

1) Input layer $\rightarrow$ D neurons.
Hidden layer $\rightarrow$ H neurons
Output layer $\rightarrow$ C neurons = 7

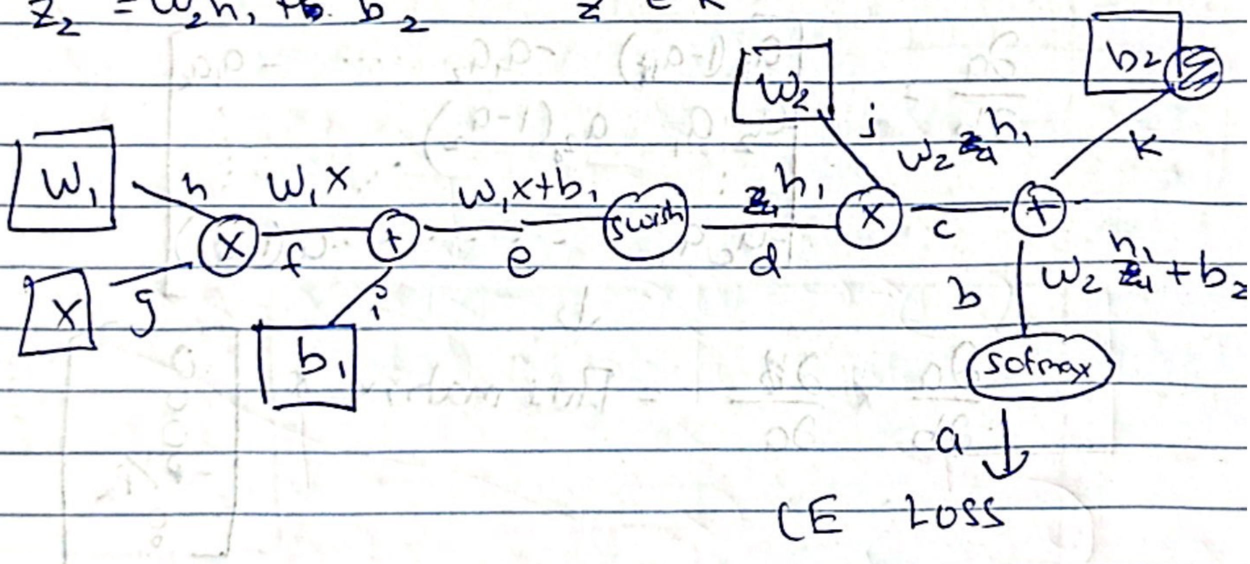
$$\text{swish}(k) = \frac{k}{1+e^{-k}} = k\,\underbrace{\sigma(k)}_{\text{sigmoid}}$$

$z_1 = W_1 x + b_1 \qquad z \in \mathbb{R}^H$

$h_1 = \text{swish}(z_1)$

$z_2 = W_2 h_1 + ~~b~~\, b_2 \qquad z \in \mathbb{R}^C$

a)



$\text{Loss} = -\log P_k$

b) $\nabla_{W_2} L = \frac{\partial L}{\quad}, \quad \nabla_{b_2} L$

where $\boxed{b = W_2 h_1 + b_2}$

$\frac{\partial L}{\partial a}$

$= \frac{\partial(-\log P_k)}{\partial a}$

$\frac{\partial L}{\partial b} = \frac{\partial a}{\partial b} \times \frac{\partial L}{\partial a}$:= ON NEXT PAGE

$\frac{\partial L}{\partial a} = [0 \;\; 0 \; \cdots \; -1/P_k \;\; 0\,0\,0]^T$ where $-1/P_k$ is for the correct class.

$$\frac{\partial a}{\partial b} = \begin{bmatrix} \quad \end{bmatrix} \in \mathbb{R}^{C \times C}$$

↓

Jacobian matrix

$$a_{ij} = \frac{e^{b_{ij}}}{\sum_{k=1}^{c} e^{b_{ik}}}$$

when $j = l$ $\quad \dfrac{\partial a_{ij}}{\partial b_{il}} = a_{ij}(1 - a_{ij})$

$j \neq l$ $\quad \dfrac{\partial a_{ij}}{\partial b_{il}} = -a_{ij} \cdot a_{il}$

$$\frac{\partial a}{\partial b} = \begin{bmatrix} a_1(1-a_1) & -a_1 a_2 & \cdots & -a_1 a_c \\ -a_2 a_1 & a_2(1-a_2) & \ddots & \vdots \\ \vdots & & & \vdots \\ -a_c a_1 & \cdots & \cdots & a_c(1-a_c) \end{bmatrix}$$

↓

$$\frac{\partial a}{\partial b} \times \frac{\partial L}{\partial a} = \text{This matrix} \times \begin{bmatrix} 0 \\ 0 \\ 0 \\ -1/p_k \\ 0 \\ \vdots \end{bmatrix}$$

$$= \cancel{a_k(1-a_k)} \begin{bmatrix} -a_1 a_k \\ -a_2 a_k \\ \vdots \\ (a_k)(1-a_k) \\ \vdots \\ -a_c a_k \end{bmatrix} \times \frac{-1}{p_k}$$

$$= \begin{bmatrix} -\sigma(x_1)\sigma(x_k) \\ -\sigma(x_2)\sigma(x_k) \\ \vdots \\ \sigma(x_k)(1-\sigma(x_k)) \\ \vdots \\ \sigma(x_c)(\sigma(x_k)) \end{bmatrix} \left(\frac{-1}{\sigma_k}\right) = \begin{bmatrix} \sigma(x_1) \\ \sigma(x_2) \\ \vdots \\ 1(1-\sigma(x_k)) \\ \vdots \\ \sigma(x_c) \end{bmatrix}$$

$$= \boxed{\text{softmax}(b) - \begin{bmatrix} 0 \\ 0 \\ \vdots \\ k \\ \vdots \end{bmatrix}}$$

$$\frac{\partial L}{\partial b} = \text{softmax}(b) - e_k$$

THUS, !!! substituting $b = z_2$

$$\boxed{\frac{\partial L}{\partial b_2} = \underbrace{\frac{\partial b}{\partial b_2}}_{1} \times \frac{\partial L}{\partial b} = 1 \times (\text{softmax}(\underbrace{z_2}_{z_2}) - e_k)}$$

$$\frac{\partial L}{\partial W_2} = \underbrace{\frac{\partial j}{\partial j}}_{h_1}^{T} \times \underbrace{\frac{\partial b}{\partial c}}_{1} \times \frac{\partial L}{\partial b} = (\text{softmax}(z_2) - e_k)h_1^T$$

shortcut Using the weird rule in class.

c) Now that we have $\frac{\partial L}{\partial d} = W_2^T(\text{softmax}(b) - e_k)$

we can back prop.

Back prop through swish.

test

$$\text{swish}(k) = \frac{k}{1+e^{-k}}$$

derivative: $\dfrac{\partial(\text{swish}(k))}{\partial k}$

$= \cancel{1\cdot(-1)\cdot(1+e^{-k})}$

$$= \boxed{\frac{1(1+e^{-k}) + k(e^{-k})}{(1+e^{-k})^2}}$$

$$\Rightarrow = \left(\frac{1}{\sigma(k)} + k\left(\frac{1}{\sigma(k)} - 1\right)\right)\sigma(k)^2$$

$$= \sigma(k) + k(\sigma(k) - \sigma(k)^2)$$

$$= \sigma(k) +$$

Substituting: $z_1 = w_1 x + b$ and $h_1 = \text{swish}(w_1 x + b)$ and $k = z_1$

$$\sigma(k) + k\sigma(k)(1-\sigma(k))$$

$$= (h_1 + \sigma(z_1)\odot(1-h_1))$$

$$\sigma(z_1) + h_1 - h_1 * \sigma(z_1)$$

$$= (h_1 + \sigma(z_1)(1-h_1))$$

Now, $\dfrac{\partial L}{\partial h} = \dfrac{\partial f}{\partial h} \times \dfrac{\partial L}{\partial f} =$

$$= ((h_1 + \sigma(z_1)\odot(1-h_1))\odot(W_2^T(\text{softmax}(z_2) - e_k)))x^T$$

$$\frac{\partial L}{\partial b} = \frac{\partial L}{\partial f} = ((h_1 + \sigma(z_1)\odot(1-h_1))\odot(W_2^T(\text{softmax}(z_2) - e_k)))$$

Scanned with CamScanner

Fully connected networks

In the previous notebook, you implemented a simple two-layer neural network class. However, this class is not modular. If you wanted to change the number of layers, you would need to write a new loss and gradient function. If you wanted to optimize the network with different optimizers, you'd need to write new training functions. If you wanted to incorporate regularizations, you'd have to modify the loss and gradient function.

Instead of having to modify functions each time, for the rest of the class, we'll work in a more modular framework where we define forward and backward layers that calculate losses and gradients respectively. Since the forward and backward layers share intermediate values that are useful for calculating both the loss and the gradient, we'll also have these function return "caches" which store useful intermediate values.

The goal is that through this modular design, we can build different sized neural networks for various applications.

In this HW #3, we'll define the basic architecture, and in HW #4, we'll build on this framework to implement different optimizers and regularizations (like BatchNorm and Dropout).

Modular layers

This notebook will build modular layers in the following manner. First, there will be a forward pass for a given layer with inputs (`x`) and return the output of that layer (`out`) as well as cached variables (`cache`) that will be used to calculate the gradient in the backward pass.

```
def layer_forward(x, w):
  """ Receive inputs x and weights w """
  # Do some computations ...
  z = # ... some intermediate value
  # Do some more computations ...
  out = # the output

  cache = (x, w, z, out) # Values we need to compute gradients

  return out, cache
```

The backward pass will receive upstream derivatives and the `cache` object, and will return gradients with respect to the inputs and weights, like this:

```
def layer_backward(dout, cache):
  """
  Receive derivative of loss with respect to outputs and cache,
  and compute derivative with respect to inputs.
  """
  # Unpack cache values
  x, w, z, out = cache
```

```
  # Use values in cache to compute derivatives
  dx = # Derivative of loss with respect to x
  dw = # Derivative of loss with respect to w

  return dx, dw
```

```

Linear layers

In this section, we'll implement the forward and backward pass for the linear layers.

The linear layer forward pass is the function `affine_forward` in `nndl/layers.py` and the backward pass is `affine_backward`.

After you have implemented these, test your implementation by running the cell below.

Affine layer forward pass

Implement `affine_forward` and then test your code by running the following cell.

```
# Test the affine_forward function

num_inputs = 2
input_shape = (4, 5, 6)
output_dim = 3

input_size = num_inputs * np.prod(input_shape)
weight_size = output_dim * np.prod(input_shape)

x = np.linspace(-0.1, 0.5, num=input_size).reshape(num_inputs,
*input_shape)
w = np.linspace(-0.2, 0.3,
num=weight_size).reshape(np.prod(input_shape), output_dim)
b = np.linspace(-0.3, 0.1, num=output_dim)

out, _ = affine_forward(x, w, b)
correct_out = np.array([[ 1.49834967,  1.70660132,  1.91485297],
                        [ 3.25553199,  3.5141327,   3.77273342]])

# Compare your output with ours. The error should be around 1e-9.
print('Testing affine_forward function:')
print('difference: {}'.format(rel_error(out, correct_out)))
```

```
Testing affine_forward function:
difference: 9.769849468192957e-10
```

Affine layer backward pass

Implement `affine_backward` and then test your code by running the following cell.

```
# Test the affine_backward function

x = np.random.randn(10, 2, 3)
```

```
w = np.random.randn(6, 5)
b = np.random.randn(5)
dout = np.random.randn(10, 5)

dx_num = eval_numerical_gradient_array(lambda x: affine_forward(x, w,
b)[0], x, dout)
dw_num = eval_numerical_gradient_array(lambda w: affine_forward(x, w,
b)[0], w, dout)
db_num = eval_numerical_gradient_array(lambda b: affine_forward(x, w,
b)[0], b, dout)

_, cache = affine_forward(x, w, b)
dx, dw, db = affine_backward(dout, cache)

# The error should be around 1e-10
print('Testing affine_backward function:')
print('dx error: {}'.format(rel_error(dx_num, dx)))
print('dw error: {}'.format(rel_error(dw_num, dw)))
print('db error: {}'.format(rel_error(db_num, db)))
```

```
Testing affine_backward function:
dx error: 5.991058029944563e-11
dw error: 1.8299032572524863e-10
db error: 1.2667152476749587e-11
```

Activation layers

In this section you'll implement the ReLU activation.

ReLU forward pass

Implement the `relu_forward` function in `nndl/layers.py` and then test your code by running the following cell.

```
# Test the relu_forward function

x = np.linspace(-0.5, 0.5, num=12).reshape(3, 4)

out, _ = relu_forward(x)
correct_out = np.array([[ 0.,          0.,          0.,          0.,
],
                        [ 0.,          0.,          0.04545455,
0.13636364,],
                        [ 0.22727273,  0.31818182,  0.40909091,  0.5,
]])

# Compare your output with ours. The error should be around 1e-8
print('Testing relu_forward function:')
print('difference: {}'.format(rel_error(out, correct_out)))
```

```
Testing relu_forward function:
difference: 4.999999798022158e-08
```

ReLU backward pass

Implement the `relu_backward` function in `nndl/layers.py` and then test your code by running the following cell.

```
x = np.random.randn(10, 10)
dout = np.random.randn(*x.shape)

dx_num = eval_numerical_gradient_array(lambda x: relu_forward(x)[0],
x, dout)

_, cache = relu_forward(x)
dx = relu_backward(dout, cache)

# The error should be around 1e-12
print('Testing relu_backward function:')
print('dx error: {}'.format(rel_error(dx_num, dx)))
```

```
Testing relu_backward function:
dx error: 3.2756301865463762e-12
```

Combining the affine and ReLU layers

Often times, an affine layer will be followed by a ReLU layer. So let's make one that puts them together. Layers that are combined are stored in `nndl/layer_utils.py`.

Affine-ReLU layers

We've implemented `affine_relu_forward()` and `affine_relu_backward` in `nndl/layer_utils.py`. Take a look at them to make sure you understand what's going on. Then run the following cell to ensure its implemented correctly.

```
from nndl.layer_utils import affine_relu_forward, affine_relu_backward

x = np.random.randn(2, 3, 4)
w = np.random.randn(12, 10)
b = np.random.randn(10)
dout = np.random.randn(2, 10)

out, cache = affine_relu_forward(x, w, b)
dx, dw, db = affine_relu_backward(dout, cache)

dx_num = eval_numerical_gradient_array(lambda x:
affine_relu_forward(x, w, b)[0], x, dout)
dw_num = eval_numerical_gradient_array(lambda w:
affine_relu_forward(x, w, b)[0], w, dout)
```

```
db_num = eval_numerical_gradient_array(lambda b:
affine_relu_forward(x, w, b)[0], b, dout)

print('Testing affine_relu_forward and affine_relu_backward:')
print('dx error: {}'.format(rel_error(dx_num, dx)))
print('dw error: {}'.format(rel_error(dw_num, dw)))
print('db error: {}'.format(rel_error(db_num, db)))
```

```
Testing affine_relu_forward and affine_relu_backward:
dx error: 4.513409204256411e-11
dw error: 2.2558493655605755e-10
db error: 8.307388460239596e-12
```

Softmax loss

You've already implemented it, so we have written it in `layers.py`. The following code will ensure they are working correctly.

```
num_classes, num_inputs = 10, 50
x = 0.001 * np.random.randn(num_inputs, num_classes)
y = np.random.randint(num_classes, size=num_inputs)

dx_num = eval_numerical_gradient(lambda x: softmax_loss(x, y)[0], x,
verbose=False)
loss, dx = softmax_loss(x, y)

# Test softmax_loss function. Loss should be 2.3 and dx error should
be 1e-8
print('\nTesting softmax_loss:')
print('loss: {}'.format(loss))
print('dx error: {}'.format(rel_error(dx_num, dx)))
```

```

Testing softmax_loss:
loss: 2.302868247381982
dx error: 1.0033469892341686e-08
```

Implementation of a two-layer NN

In `nndl/fc_net.py`, implement the class `TwoLayerNet` which uses the layers you made here. When you have finished, the following cell will test your implementation.

```
N, D, H, C = 3, 5, 50, 7
X = np.random.randn(N, D)
y = np.random.randint(C, size=N)

std = 1e-2
```

```
model = TwoLayerNet(input_dim=D, hidden_dims=H, num_classes=C,
weight_scale=std)

print('Testing initialization ... ')
W1_std = abs(model.params['W1'].std() - std)
b1 = model.params['b1']
W2_std = abs(model.params['W2'].std() - std)
b2 = model.params['b2']
assert W1_std < std / 10, 'First layer weights do not seem right'
assert np.all(b1 == 0), 'First layer biases do not seem right'
assert W2_std < std / 10, 'Second layer weights do not seem right'
assert np.all(b2 == 0), 'Second layer biases do not seem right'

print('Testing test-time forward pass ... ')
model.params['W1'] = np.linspace(-0.7, 0.3, num=D*H).reshape(D, H)
model.params['b1'] = np.linspace(-0.1, 0.9, num=H)
model.params['W2'] = np.linspace(-0.3, 0.4, num=H*C).reshape(H, C)
model.params['b2'] = np.linspace(-0.9, 0.1, num=C)
X = np.linspace(-5.5, 4.5, num=N*D).reshape(D, N).T
scores = model.loss(X)
correct_scores = np.asarray(
  [[11.53165108,  12.2917344,   13.05181771,  13.81190102,

Solver

We will now use the utils Solver class to train these networks. Familiarize yourself with the API in `utils/solver.py`. After you have done so, declare an instance of a TwoLayerNet with 200 units and then train it with the Solver. Choose parameters so that your validation accuracy is at least 50%.

```
model = TwoLayerNet()
solver = None

# ================================================================ #
# YOUR CODE HERE:
#   Declare an instance of a TwoLayerNet and then train
#   it with the Solver. Choose hyperparameters so that your validation

#   accuracy is at least 50%.  We won't have you optimize this further
#   since you did it in the previous notebook.
#
# ================================================================ #

model = TwoLayerNet(hidden_dims=200)
solver = Solver(model=model, data=data, optim_config={'learning_rate':
0.0006}, lr_decay=0.9, num_train_samples=2000, num_epochs=10,
batch_size=200, print_every=50)
solver.train()

# ================================================================ #
# END YOUR CODE HERE
# ================================================================ #
```

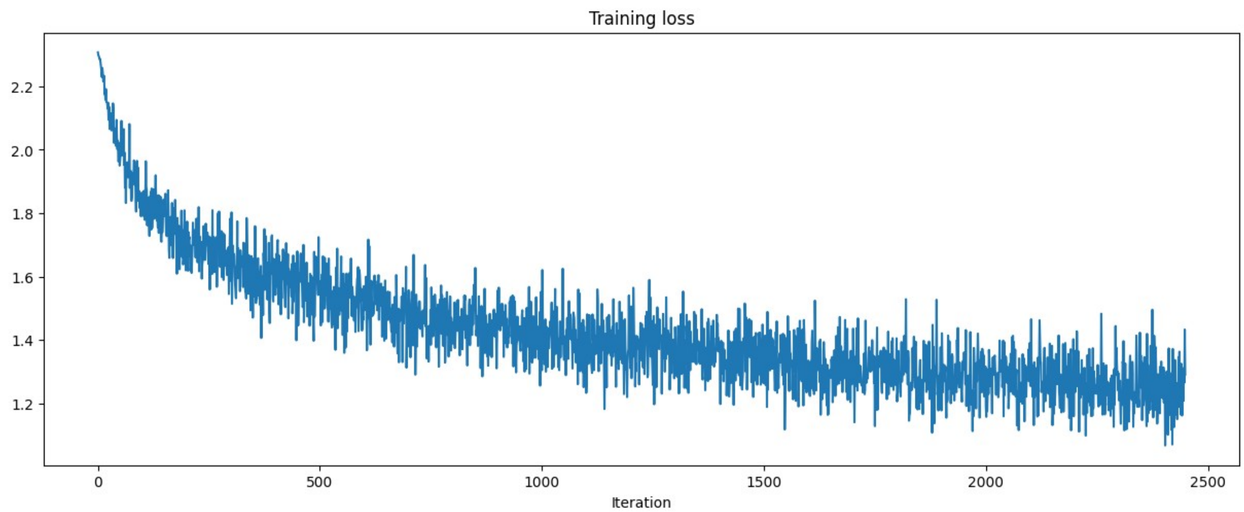
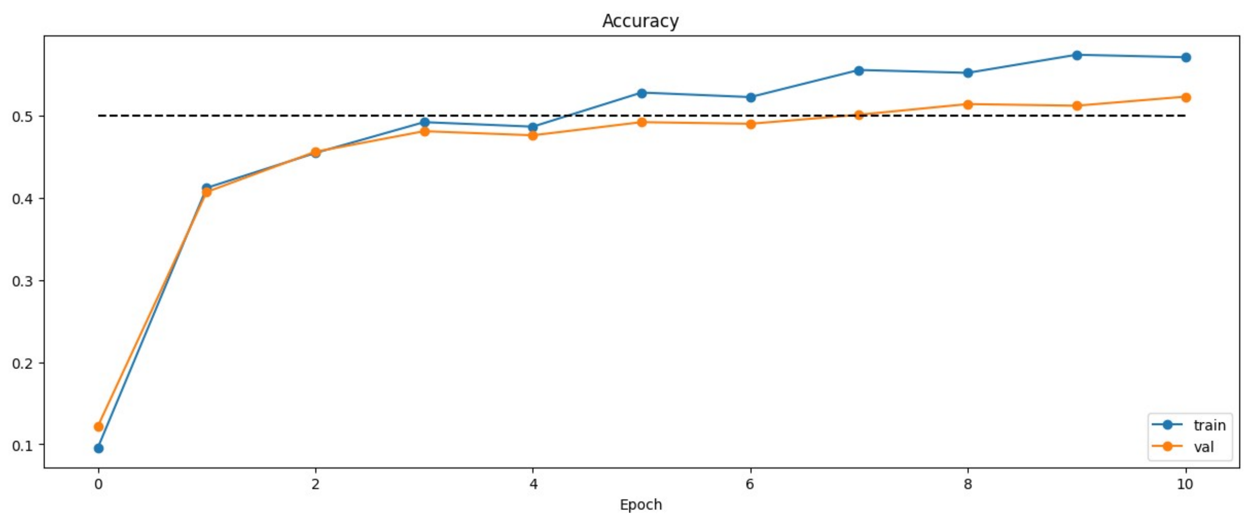
plt.show()
```





Multilayer Neural Network

Now, we implement a multi-layer neural network.

Read through the `FullyConnectedNet` class in the file `nndl/fc_net.py`.

Implement the initialization, the forward pass, and the backward pass. There will be lines for batchnorm and dropout layers and caches; ignore these all for now. That'll be in HW #4.

```
N, D, H1, H2, C = 2, 15, 20, 30, 10
X = np.random.randn(N, D)
y = np.random.randint(C, size=(N,))

for reg in [0, 3.14]:
  print('Running check with reg = {}'.format(reg))
  model = FullyConnectedNet([H1, H2], input_dim=D, num_classes=C,
                            reg=reg, weight_scale=5e-2,
dtype=np.float64)
```

```
  loss, grads = model.loss(X, y)
  print('Initial loss: {}'.format(loss))

  for name in sorted(grads):
    f = lambda _: model.loss(X, y)[0]
    grad_num = eval_numerical_gradient(f, model.params[name],
verbose=False, h=1e-5)
    print('{} relative error: {}'.format(name, rel_error(grad_num,
grads[name])))
```

```
Running check with reg = 0
Initial loss: 2.3029647255985943
W1 relative error: 7.25474992251241e-06
W2 relative error: 1.3653886594193302e-06
W3 relative error: 4.016447031312336e-07
b1 relative error: 4.3744119680732e-08
b2 relative error: 3.242335147561271e-09
b3 relative error: 7.450748227701268e-11
Running check with reg = 3.14
Initial loss: 6.78836760928242
W1 relative error: 2.698213332263102e-08
W2 relative error: 1.9675435737221835e-08
W3 relative error: 1.1067262553151193e-08
b1 relative error: 2.5741770601558084e-08
b2 relative error: 1.3450279529674712e-08
b3 relative error: 3.217926375348156e-10
```

```
# Use the three layer neural network to overfit a small dataset.

num_train = 50
small_data = {
  'X_train': data['X_train'][:num_train],
  'y_train': data['y_train'][:num_train],
  'X_val': data['X_val'],
  'y_val': data['y_val'],
}

#### !!!!!!
# Play around with the weight_scale and learning_rate so that you can
overfit a small dataset.
# Your training accuracy should be 1.0 to receive full credit on this
part.
weight_scale = 1e-2
learning_rate = 1e-2

model = FullyConnectedNet([100, 100],
              weight_scale=weight_scale, dtype=np.float64)

This is the 2-layer neural network notebook for ECE C147/C247 Homework #3

Please follow the notebook linearly to implement a two layer neural network.

Please print out the notebook entirely when completed.

The goal of this notebook is to give you experience with training a two layer neural network.

```
import random
import numpy as np
from utils.data_utils import load_CIFAR10
import matplotlib.pyplot as plt

%matplotlib inline
%load_ext autoreload
%autoreload 2

def rel_error(x, y):
    """ returns relative error """
    return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) +
np.abs(y))))
```

```
The autoreload extension is already loaded. To reload it, use:
  %reload_ext autoreload
```

Toy example

Before loading CIFAR-10, there will be a toy example to test your implementation of the forward and backward pass. Make sure to read the description of TwoLayerNet class in neural_net.py file , understand the architecture and initializations

```
from nndl.neural_net import TwoLayerNet

# Create a small net and some toy data to check your implementations.
# Note that we set the random seed for repeatable experiments.
input_size = 4
hidden_size = 10
num_classes = 3
num_inputs = 5

def init_toy_model():
    np.random.seed(0)
    return TwoLayerNet(input_size, hidden_size, num_classes, std=1e-1)

def init_toy_data():
    np.random.seed(1)
    X = 10 * np.random.randn(num_inputs, input_size)
```

```
    y = np.array([0, 1, 2, 2, 1])
    return X, y

net = init_toy_model()
X, y = init_toy_data()
```

Compute forward pass scores

```
## Implement the forward pass of the neural network.
## See the loss() method in TwoLayerNet class for the same

# Note, there is a statement if y is None: return scores, which is why

# the following call will calculate the scores.
scores = net.loss(X)
print('Your scores:')
print(scores)
print()
print('correct scores:')
correct_scores = np.asarray([
    [-1.07260209,  0.05083871, -0.87253915],
    [-2.02778743, -0.10832494, -1.52641362],
    [-0.74225908,  0.15259725, -0.39578548],
    [-0.38172726,  0.10835902, -0.17328274],
    [-0.64417314, -0.18886813, -0.41106892]])
print(correct_scores)
print()

# The difference should be very small. We get < 1e-7
print('Difference between your scores and correct scores:')
print(np.sum(np.abs(scores - correct_scores)))
```

```
Your scores:
[[-1.07260209  0.05083871 -0.87253915]
 [-2.02778743 -0.10832494 -1.52641362]
 [-0.74225908  0.15259725 -0.39578548]
 [-0.38172726  0.10835902 -0.17328274]
 [-0.64417314 -0.18886813 -0.41106892]]

correct scores:
[[-1.07260209  0.05083871 -0.87253915]
 [-2.02778743 -0.10832494 -1.52641362]
 [-0.74225908  0.15259725 -0.39578548]
 [-0.38172726  0.10835902 -0.17328274]
 [-0.64417314 -0.18886813 -0.41106892]]

Difference between your scores and correct scores:
3.381231233889892e-08
```

Forward pass loss

```
loss, _ = net.loss(X, y, reg=0.05)
correct_loss = 1.071696123862817

# should be very small, we get < 1e-12
print("Loss:",loss)
print('Difference between your loss and correct loss:')
print(np.sum(np.abs(loss - correct_loss)))
```

```
Loss: 1.071696123862817
Difference between your loss and correct loss:
0.0
```

Backward pass

Implements the backwards pass of the neural network. Check your gradients with the gradient check utilities provided.

```
from utils.gradient_check import eval_numerical_gradient

# Use numeric gradient checking to check your implementation of the
backward pass.
# If your implementation is correct, the difference between the
numeric and
# analytic gradients should be less than 1e-8 for each of W1, W2, b1,
and b2.

loss, grads = net.loss(X, y, reg=0.05)

# these should all be less than 1e-8 or so
for param_name in grads:
    f = lambda W: net.loss(X, y, reg=0.05)[0]
    param_grad_num = eval_numerical_gradient(f,
net.params[param_name], verbose=False)
    print('{} max relative error: {}'.format(param_name,
rel_error(param_grad_num, grads[param_name])))
```

```
W2 max relative error: 2.9632227682005116e-10
b2 max relative error: 1.2482660547101085e-09
W1 max relative error: 1.2832874456864775e-09
b1 max relative error: 3.1726806716844575e-09
```

Training the network

Implement neural_net.train() to train the network via stochastic gradient descent, much like the softmax and SVM.

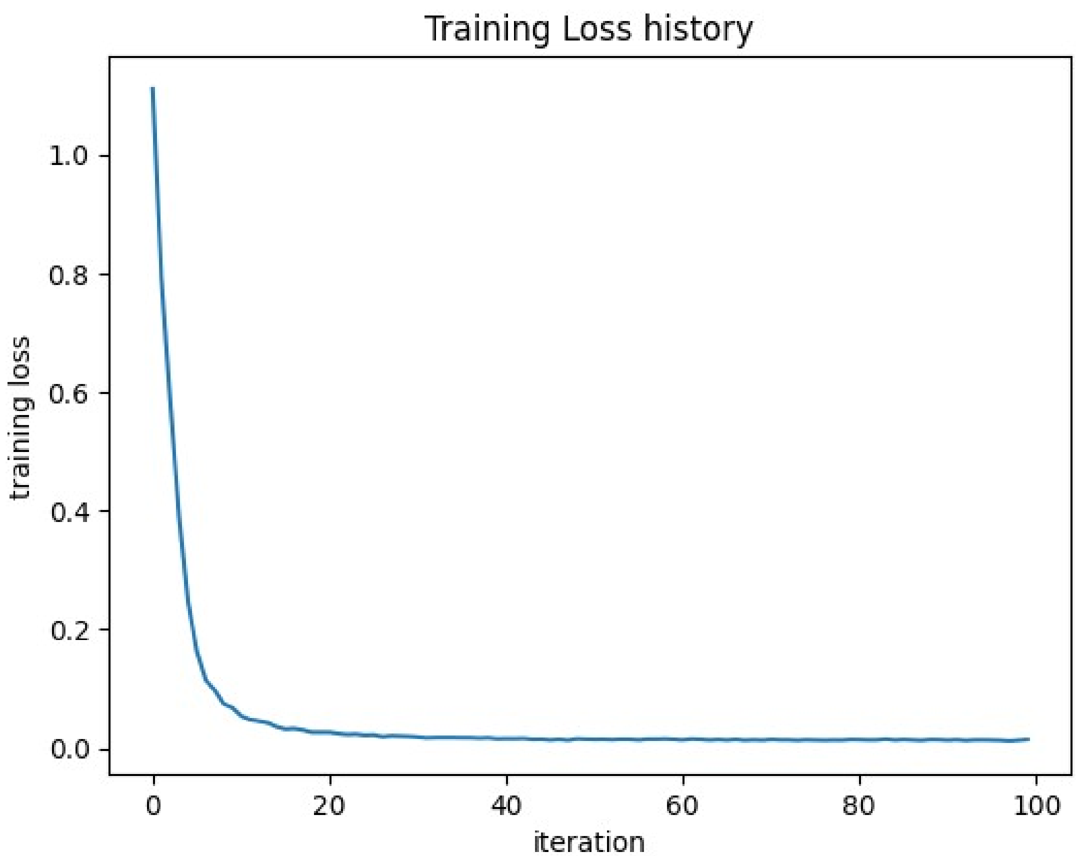
```
net = init_toy_model()
stats = net.train(X, y, X, y,
```

```
            learning_rate=1e-1, reg=5e-6,
            num_iters=100, verbose=False)

print('Final training loss: ', stats['loss_history'][-1])

# plot the loss history
plt.plot(stats['loss_history'])
plt.xlabel('iteration')
plt.ylabel('training loss')
plt.title('Training Loss history')
plt.show()
```

```
Final training loss:  0.014497864587765906
```



Classify CIFAR-10

Do classification on the CIFAR-10 dataset.

```
from utils.data_utils import load_CIFAR10

def get_CIFAR10_data(num_training=49000, num_validation=1000,
num_test=1000):
```

```
    """
    Load the CIFAR-10 dataset from disk and perform preprocessing to
prepare
    it for the two-layer neural net classifier.
    """
    # Load the raw CIFAR-10 data
    cifar10_dir =
'/Users/krishpatel/Desktop/HW3_code/utils/datasets/cifar-10-batches-
py' # remember to use correct path
    X_train, y_train, X_test, y_test = load_CIFAR10(cifar10_dir)

    # Subsample the data
    mask = list(range(num_training, num_training + num_validation))
    X_val = X_train[mask]
    y_val = y_train[mask]
    mask = list(range(num_training))
    X_train = X_train[mask]
    y_train = y_train[mask]
    mask = list(range(num_test))
    X_test = X_test[mask]
    y_test = y_test[mask]

    # Normalize the data: subtract the mean image
    mean_image = np.mean(X_train, axis=0)
    X_train -= mean_image
    X_val -= mean_image
    X_test -= mean_image

    # Reshape data to rows
    X_train = X_train.reshape(num_training, -1)
    X_val = X_val.reshape(num_validation, -1)
    X_test = X_test.reshape(num_test, -1)

    return X_train, y_train, X_val, y_val, X_test, y_test

# Invoke the above function to get our data.
X_train, y_train, X_val, y_val, X_test, y_test = get_CIFAR10_data()
print('Train data shape: ', X_train.shape)
print('Train labels shape: ', y_train.shape)
print('Validation data shape: ', X_val.shape)
print('Validation labels shape: ', y_val.shape)
print('Test data shape: ', X_test.shape)
print('Test labels shape: ', y_test.shape)
```

```
Train data shape:  (49000, 3072)
Train labels shape:  (49000,)
Validation data shape:  (1000, 3072)
Validation labels shape:  (1000,)
```

```
Test data shape:  (1000, 3072)
Test labels shape:  (1000,)
```

Running SGD

If your implementation is correct, you should see a validation accuracy of around 28-29%.

```python
input_size = 32 * 32 * 3
hidden_size = 50
num_classes = 10
net = TwoLayerNet(input_size, hidden_size, num_classes)

# Train the network
stats = net.train(X_train, y_train, X_val, y_val,
            num_iters=1000, batch_size=200,
            learning_rate=1e-4, learning_rate_decay=0.95,
            reg=0.25, verbose=True)

# Predict on the validation set
val_acc = (net.predict(X_val) == y_val).mean()
print('Validation accuracy: ', val_acc)

# Save this net as the variable subopt_net for later comparison.
subopt_net = net
```

```
iteration 0 / 1000: loss 2.302757518613176
iteration 100 / 1000: loss 2.302120159207236
iteration 200 / 1000: loss 2.2956136007408703
iteration 300 / 1000: loss 2.2518259043164135
iteration 400 / 1000: loss 2.188995235046776
iteration 500 / 1000: loss 2.1162527791897747
iteration 600 / 1000: loss 2.064670827698217
iteration 700 / 1000: loss 1.9901688623083942
iteration 800 / 1000: loss 2.002827640124685
iteration 900 / 1000: loss 1.9465176817856502
Validation accuracy:  0.283
```

Questions:

The training accuracy isn't great.

(1) What are some of the reasons why this is the case? Take the following cell to do some analyses and then report your answers in the cell following the one below.

(2) How should you fix the problems you identified in (1)?

```python
stats['train_acc_history']
```

```
[0.095, 0.15, 0.25, 0.25, 0.315]
```

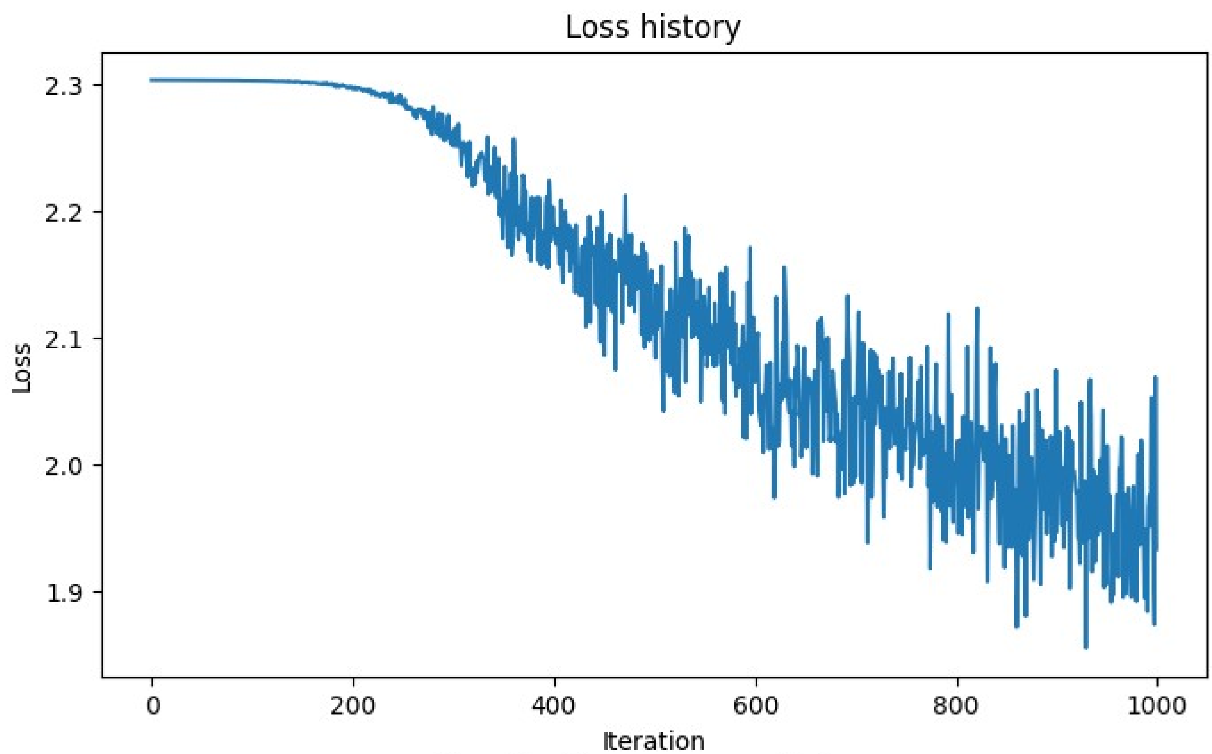
```
# ================================================================ #
# YOUR CODE HERE:
#   Do some debugging to gain some insight into why the optimization
#   isn't great.
# ================================================================ #

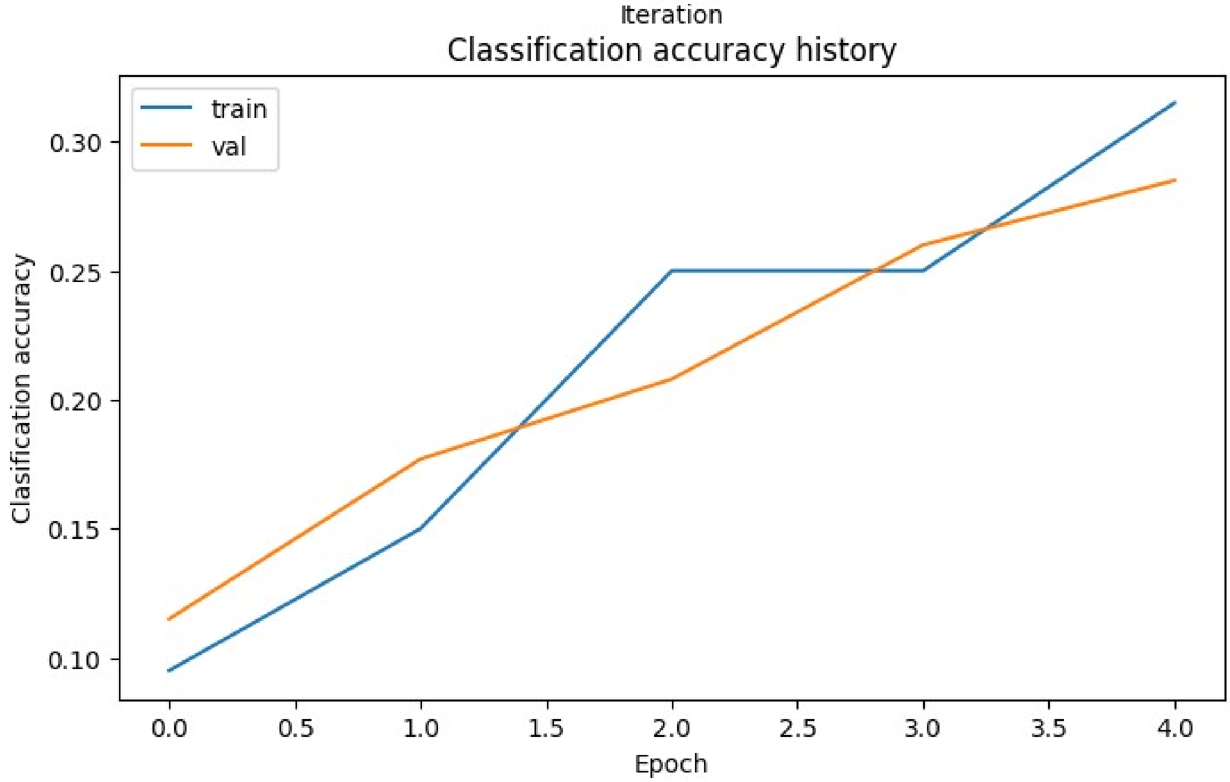
# Plot the loss function and train / validation accuracies

fig, ax = plt.subplots(2, 1, figsize=(8, 10))
ax[0].plot(stats['loss_history'])
ax[0].set_title('Loss history')
ax[0].set_xlabel('Iteration')
ax[0].set_ylabel('Loss')

ax[1].plot(stats['train_acc_history'], label='train')
ax[1].plot(stats['val_acc_history'], label='val')
ax[1].set_title('Classification accuracy history')
ax[1].set_xlabel('Epoch')
ax[1].set_ylabel('Clasification accuracy')
ax[1].legend()
plt.show()

# ================================================================ #
# END YOUR CODE HERE
# ================================================================ #
```





Answers:

(1) According to the Loss Vs Iteration graph, it appears that the loss doesn't decrease by a large factorand instead stays almost flat, hinting that the learning rate might be too low. Also, both

the training and validation sets show similar but poor accuracy, and haven't reached convergence or stability. This suggests we might need more iterations to see improvements.

(2) To improve accuracy, we need to adjust certain settings such as our learning rate parameter, the iteration count, how much we penalize complex models (regularization coefficient), and the number of samples per batch (batch size).

Optimize the neural network

Use the following part of the Jupyter notebook to optimize your hyperparameters on the validation set. Store your nets as best_net.

```
best_net = None # store the best model into this

# ================================================================ #
# YOUR CODE HERE:
#   Optimize over your hyperparameters to arrive at the best neural
#   network.  You should be able to get over 50% validation accuracy.
#   For this part of the notebook, we will give credit based on the
#   accuracy you get.  Your score on this question will be multiplied
by:
#      min(floor((X - 28%)) / %22, 1)
#   where if you get 50% or higher validation accuracy, you get full
#   points.
#
#   Note, you need to use the same network structure (keep hidden_size
= 50)!
# ================================================================ #
input_size = 32 * 32 * 3
hidden_size = 50
num_classes = 10

iteration_numbers = np.arange(2, 4) * 10**3
reg_coefs = np.arange(0.1, 0.25, 0.05)

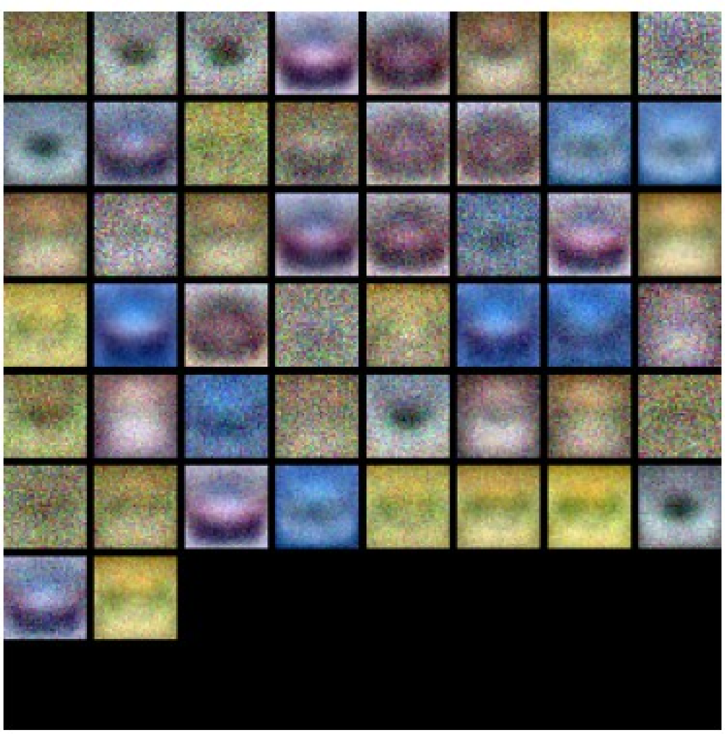
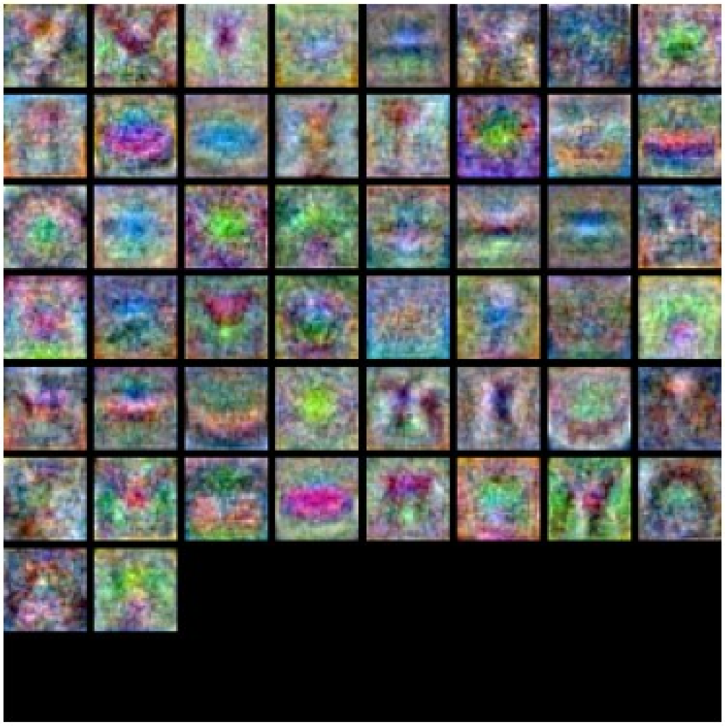
```python
from utils.vis_utils import visualize_grid

# Visualize the weights of the network

def show_net_weights(net):
    W1 = net.params['W1']
    W1 = W1.T.reshape(32, 32, 3, -1).transpose(3, 0, 1, 2)
    plt.imshow(visualize_grid(W1, padding=3).astype('uint8'))
    plt.gca().axis('off')
    plt.show()

show_net_weights(subopt_net)
show_net_weights(best_net)
```





Question:

(1) What differences do you see in the weights between the suboptimal net and the best net you arrived at?

Answer:

(1) The best net seems to preserve more features about the visual charactersistics. However in the subopt, all of the features seem to be much more blurred(looks like a gaussian blue), thus suggesting that the latesr don't do well at preserving the features.

Evaluate on test set

```
test_acc = (best_net.predict(X_test) == y_test).mean()
print('Test accuracy: ', test_acc)

Test accuracy:  0.489
```

```python
import numpy as np

from .layers import *
from .layer_utils import *

class TwoLayerNet(object):
  """
  A two-layer fully-connected neural network with ReLU nonlinearity and
  softmax loss that uses a modular layer design. We assume an input dimension
  of D, a hidden dimension of H, and perform classification over C classes.

  The architecure should be affine - relu - affine - softmax.

  Note that this class does not implement gradient descent; instead, it
  will interact with a separate Solver object that is responsible for running
  optimization.

  The learnable parameters of the model are stored in the dictionary
  self.params that maps parameter names to numpy arrays.
  """
